Holistic Generation of Slide Decks Entirely from Nano Banana Pro

From Collage to Rendering: A New Paradigm

Yan Wang 🌐 yage.ai

The Problem: Standard slides are fragmented and disjointed.

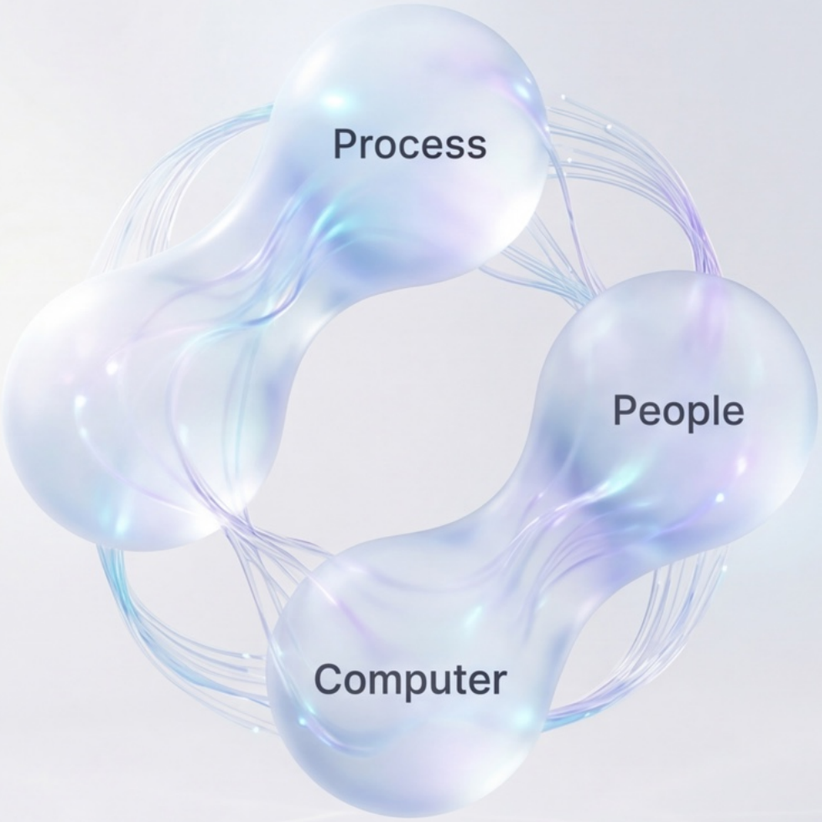
The Goal: Achieve “Steve Jobs” quality visuals instantly.

The Shift: From manual “Assembling” to holistic “Rendering”.

Current Workflow

1. Hunt for separate icons
2. Manually align boxes
3. Zero visual consistency

Holistic Scene Generation



Perfect Visual Integrity

The Reality Check (The Challenge)

1. **Entropy:** Styles drift randomly between slides.
2. **Hallucinations:** Fake QR codes and garbled text.
3. **Isolation:** No interactivity, just static pixels.

The Architecture

1. Probabilistic AI

2. Constraints & SOP

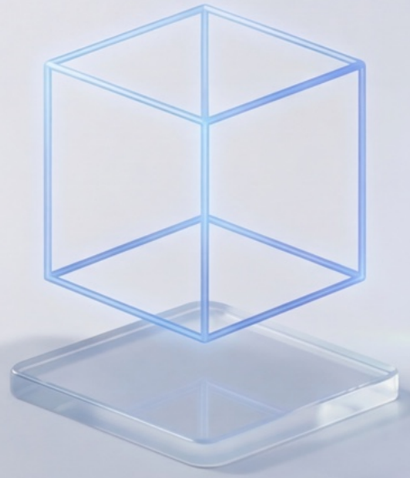
3. Deterministic Code

The Generative Kernel:
A Deterministic Container
for Probabilistic Creativity.

Technique 1: Visual Anchoring.

Don’t describe styles. Show them.

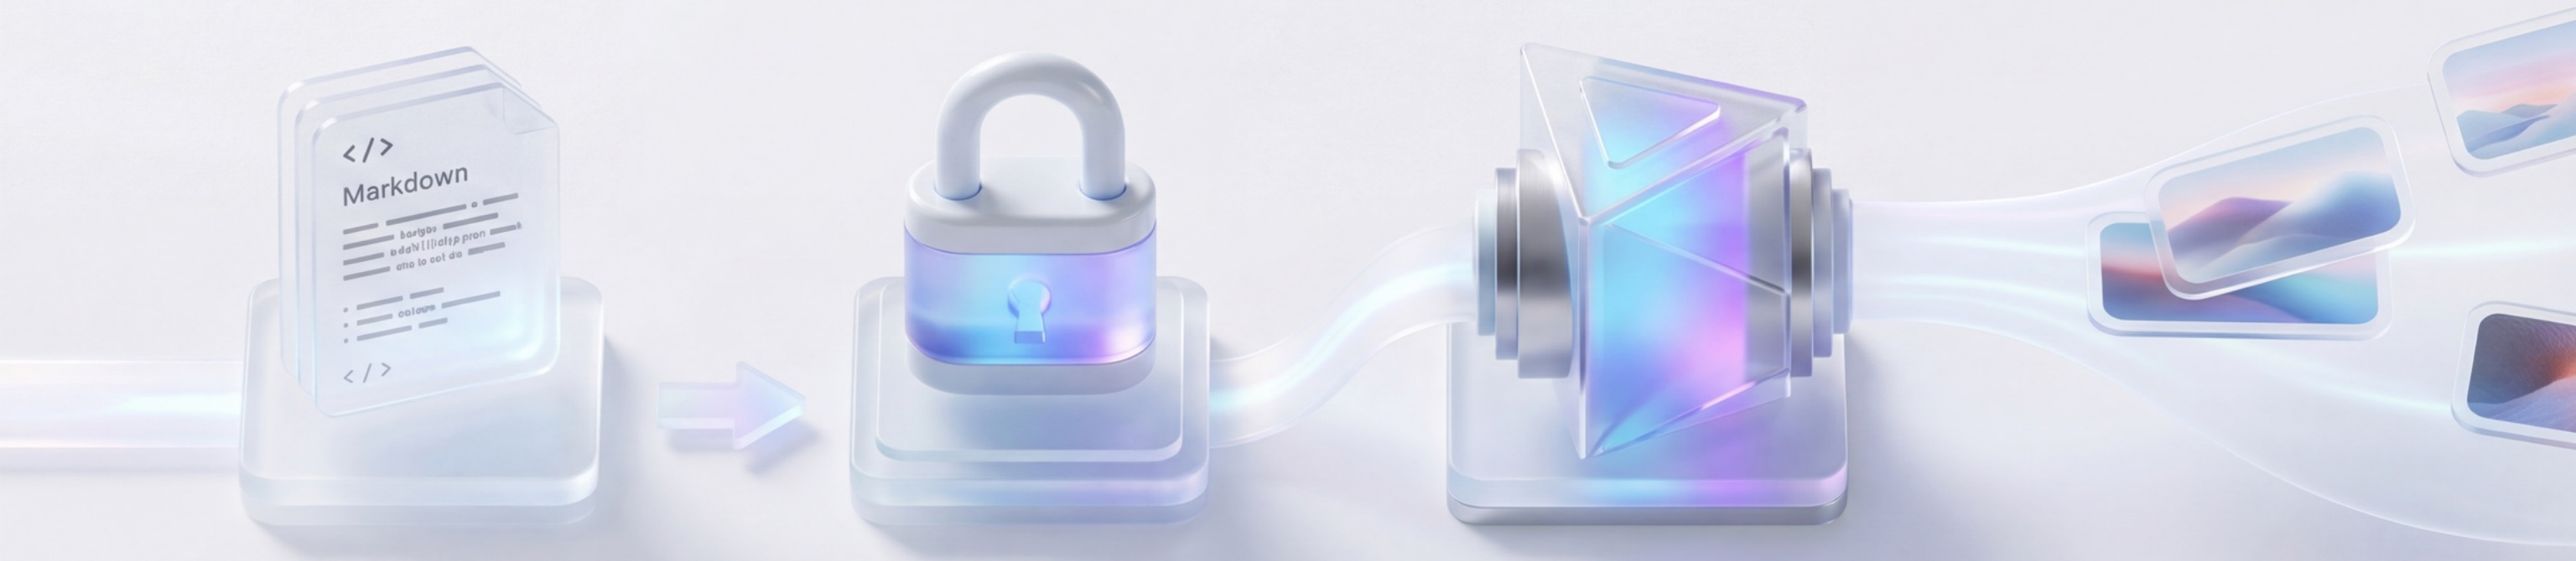
Input



Output

Technique 2:
Asset Injection
Context Curation: Inject raw pixels,
render the lighting and texture.

TECHNIQUE 3 - DELAYED RENDERING



Content Logic

Lock-down

Batch Render

Optimization: Lock content first. Render once at the very end.

The Methodology: delivering User Generated Software potential.

The Product
(Static)

Beyond DRY (Don’t Repeat Yourself). Moving from Static Deliverables to Generative Systems.

Intention Fidelity | Expression Range | User Efficiency
